Attachment: 9251 Soybean (April, 1986)

Exhibit A: Variety 9251 evolved from a cross of S1492 X A2575. It is an F5-derived variety which was advanced to the F5 generation by modified single-seed descent. The F6 progeny row of 9251 was grown in Iowa during the summer of 1981. Subsequently, 9251 has undergone four years of extensive testing and purification. It has been observed by the breeder to be uniform and stable for all plant traits from generation to generation with no evidence of variants.

3 acres of 9251 (breeders seed) were grown in 1984 and 49 acres (foundation seed equivalent) were grown in 1985.

Exhibit B: 9251 is most similar to variety DSR 227. However, it is resistant to races 1 and 2 of Phytophthora, and has a low seed protein peroxidase activity; whereas DSR 227 is susceptible to Phytophthora (races 1 and 2) and has high peroxidase activity. Variety 9251 is also significantly shorter in height than DSR 227 by more than 4 inches (see Table 1).

Exhibit E: Pioneer Hi-Bred International, Inc. is the sole, original, and first breeder of the '9251' variety of soybeans for which it solicits a certificate of protection.
